about infant MRI

Magnetic Resonance Imaging (MRI) is a non-invasive and painless procedure that uses a magnet to create images of the body's organs; in this case, we will take pictures of your baby's brain. The MRI takes place at the ACH Radiology department and will not use any radiation.

designed for babies

Our infant MRI protocol is crafted for baby's comfort! Prior to the MRI scan we have you feed your baby and then we swaddle them in warm sheets and securely position them inside the MRI machine. We provide ear muffs to protect them from the noise and let them sleep through the test. An MRI technologist will monitor your child through an MRI-compatible camera and nurses will be available if needed. You will also be able to stay in the scan room with your baby. The total MRI scan time is about 30-45 minutes. This protocol is commonly used in clinical practice at ACH and there is no additional risk than a routine MRI scan. If you have further questions or concerns, please don't hesitate to contact us!
